## ECE 305 - Spring 2018

Exam 4 - Thursday, April 12, 2018
This is a closed book exam. You may use a calculator and the formula sheet at the end of this exam. Following the ECE policy, the calculator must be a Texas Instruments TI-30X IIS scientific calculator.

To receive full credit, you must show your work (scratch paper is attached).
The exam is designed to be taken in 60 minutes (or less). Be sure to fill in your name and Purdue student ID at the top of the page. DO NOT open the exam until told to do so, and stop working immediately when time is called. The last 2 pages are equation sheets, which you may remove, if you want.

100 points possible,
I) 40 points ( 8 points per question)
II) 30 points
III) 30 points

Course policy
If I am caught cheating, I will earn an F in the course \& be reported to the Dean of Students.
I repeat: $\qquad$
$\qquad$
Signature: $\qquad$

1 (8 points). Gradually introducing a limited number of mobile positive charges into the gate oxide of a MOS-capacitor would:
a. Make the oxide highly conductive
b. Erode the oxide over time, leaving an empty gap between the gate and channel
c. Dope the silicon substrate
d. Change the threshold voltage over time
e. Change the flatband voltage with time

2 (8 points). For a polycrystalline Si gate MOS capacitor, changing the doping in the crystalline Si substrate would change the threshold voltage as
a. $\mathrm{V}_{\mathrm{FB}}$ changes
b. $\Phi_{\mathrm{F}}$ changes
c. $\Delta V_{O X}$ changes
d. a. and c. only
e. All of the above

3 (8 points). When $\mathrm{V}_{\mathrm{G}}=\mathrm{V}_{\mathrm{T}}$ for an $\mathrm{n}-\mathrm{MOSFET}$, what is the value of the semiconductor potential $\Phi_{\mathrm{S}}$ ?
a. $0.6 \Phi_{\mathrm{F}}$
b. $1.2 \Phi_{\mathrm{F}}$
c. $1.5 \Phi_{\mathrm{F}}$
d. $2 \Phi_{\mathrm{F}}$
e. $2.4 \oplus_{\mathrm{F}}$

4 (8 points) How does the saturated current of a n-channel MOSFET in the long-channel regime vary with the gate voltage $V_{G S}$ ?
a. $\left(V_{G S}-V_{T}\right)^{2}$
b. $\left(V_{G S}-V_{T}\right)^{1.5}$
c. $\left(V_{G S}-V_{T}\right)^{1.0}$
d. $\left(V_{G S}-V_{T}\right)^{0.5}$
e. $\left(V_{G S}-V_{T}\right)^{-2}$

5 (8 points). When minority free carriers are found near the oxide-Si interface of a MOS device, what is the bias condition?
a. Depletion
b. Inversion
c. Flatband
d. Deep accumulation
e. Accumulation

## Part II (Free Response, 30 points)

Consider an MOS capacitor made of crystalline silicon described by the band diagram below. Note that unmarked values may not be to scale. Assume that $\left|\Delta V_{O X}\right|=0.9 \mathrm{~V}, t_{o x}=3.0 \mathrm{~nm}, K_{o x}=3.9, K_{S i}=11.7$, and $E_{g}=1.12 \mathrm{eV}$.

a. What is the magnitude of the electric field in the semiconductor right next to the oxide $\left(x=0^{+}\right)$?

$$
\left|\varepsilon_{s}\right|=\frac{K_{o x}}{K_{s}} \frac{\Delta V_{o x}}{t_{o x}}=\frac{3.9}{11.8} \cdot \frac{0.9 \mathrm{~V}}{3 \times 10^{-7} \mathrm{~cm}}=1 \times 10^{6} \mathrm{~V} / \mathrm{cm}
$$

b. What is the magnitude of the electrostatic potential voltage of the gate electrode with respect to the semiconductor, assuming the flat band voltage $\mathrm{V}_{\mathrm{FB}}$ is 0 ? Assume that $N_{D}=4.7 \cdot 10^{18} \mathrm{~cm}^{-3}$.

$$
\begin{gathered}
W=\frac{K_{S} \epsilon_{o}\left|\varepsilon_{s}\right|}{q N_{D}}=\frac{11.8 \cdot\left(8.854 \cdot 10^{-14} \mathrm{~F} / \mathrm{cm}\right)\left(1 \times 10^{6} \mathrm{~V} / \mathrm{cm}\right)}{\left(1.602 \cdot 10^{-19} \mathrm{C}\right) \cdot\left(4.7 \cdot 10^{18} \mathrm{~cm}^{-3}\right)}=13.9 \mathrm{~nm} \\
\left|V_{G}\right|=\left|\Delta V_{o x}+\phi_{S}\right|=\left|\Delta V_{o x}+\frac{1}{2} \varepsilon_{s} W\right|=0.9 \mathrm{~V}+\frac{1}{2}\left(1 \times 10^{6} \mathrm{~V} / \mathrm{cm}\right)(13.9 \mathrm{~nm})=1.59 \mathrm{~V}
\end{gathered}
$$

c. For the above diagram, which regime is the capacitor operating in? If the gate voltage is kept constant, but the oxide thickness is reduced gradually, eventually the operating regime changes. What would be the new operating regime?
It appears to be in the depletion regime, since $\phi_{S}<2 \phi_{F}$. However, a thinner gate oxide would increase $\phi_{s}$, eventually pushing the system into inversion.

## Part III (Free Response, 30 points)

Consider a pair of p-channel (left) and n-channel (right) carbon nanotube-based MOSFETs, characterized in terms of drain current as a function of gate voltage and drain voltage.

a. Estimate the saturation threshold voltage $\left(V_{T, S A T}\right)$ for both types of logic. Justify your answer.

$$
\begin{gathered}
V_{T, S A T}(\mathrm{p} \mathrm{FET}) \approx-0.9 \mathrm{~V} \text { to }-1 \mathrm{~V} \\
V_{T, S A T}(\mathrm{n} \mathrm{FET}) \approx-0.25 \mathrm{~V} \text { to }+0.1 \mathrm{~V}
\end{gathered}
$$

b. Estimate the drain-induced barrier lowering for both types of logic.
$\operatorname{DIBL}(\mathrm{p}-\mathrm{FET}) \approx 100 \mathrm{mV} / 0.9 \mathrm{~V}=110 \mathrm{mV} / \mathrm{V}$

DIBL(n-FET) $\approx 600 \mathrm{mV} / 0.9 \mathrm{~V}=670 \mathrm{mV} / \mathrm{V}$
c. How can the asymmetry in the output characteristics for comparable $V_{G}-V_{T}$ values be explained?

The carrier mobilities, channel lengths, and gate oxide thicknesses might differ.
d. Find and mention the best performing device here in terms of subthreshold slope. State the subthreshold slope and the operating conditions to obtain that optimum performance.

Clearly, p-FETs have the best subthreshold slope. The value is about $100 \mathrm{mV} /$ decade. The value for n -FETs is about 200 to 250 mV /decade.
e. Is this carbon nanotube MOSFET superior to a conventional crystalline Si MOSFET? Justify your answer.

Not in terms of performance, since c-Si MOSFETs have higher on-off ratios and saturation currents, given sufficient gate widths. C-Si MOSFETs also generally have less noisy output characteristics.

The main advantage is in terms of size - CNT MOSFETs can be much smaller. They also can have higher mobilities than conventional Si, and thus may have higher saturation current densities.

## ECE 305 Exam 4 Formula Sheet (Spring 2018)

You may remove these pages from the exam packet, and take them with you.

| Physical Constants | Silicon parameters $(\mathbf{T}=\mathbf{3 0 0} \mathbf{K})$ |
| :---: | :---: |
| $h / 2 \pi=\hbar=1.055 \times 10^{-34} \mathrm{~J} \cdot \mathrm{~s}$ | $N_{C}=3.23 \times 10^{19} \mathrm{~cm}^{-3}$ |
| $m_{0}=9.109 \times 10^{-31} \mathrm{~kg}$ | $N_{V}=1.83 \times 10^{19} \mathrm{~cm}^{-3}$ |
| $k_{B}=1.38 \times 10^{-23} \mathrm{~J} / \mathrm{K}$ | $n_{i}=1.1 \times 10^{10} \mathrm{~cm}^{-3}$ |
| $q=1.602 \times 10^{-19} \mathrm{C}$ | $K_{s}=11.8$ |
| $\epsilon_{0}=8.854 \times 10^{-12} \mathrm{~F} / \mathrm{m}$ | $E_{g}=1.12 \mathrm{eV} ; \chi=4.03 \mathrm{eV}$ |

Miller Indices: (hkl) \{hkl\} [hkl] <hkl>
Density of states $g_{C}(E)=\frac{\left(m_{n}^{*}\right)^{3 / 2} \sqrt{2\left(E-E_{C}\right)}}{\pi^{2} \hbar^{3}}$
Fermi function $f(E)=\frac{1}{1+e^{\left(E-E_{F}\right) / k T}} \quad$ Intrinsic carrier concentration $n_{i}=\sqrt{N_{C} N_{V}} e^{-E_{g} / 2 k T}$
Equilibrium carrier densities: $N_{C}=\frac{1}{4}\left(\frac{2 m_{n}^{*} k T}{\pi \hbar^{2}}\right)^{3 / 2} \quad N_{V}=\frac{1}{4}\left(\frac{2 m_{p}^{*} k T}{\pi \hbar^{2}}\right)^{3 / 2}$
$n_{0}=N_{C} e^{\left(E_{F}-E_{C}\right) / k T}=n_{i} e^{\left(E_{F}-E_{i}\right) / k T}$
$p_{0}=N_{V} e^{\left(E_{V}-E_{F}\right) / k T}=n_{i} e^{\left(E_{i}-E_{F}\right) / k T}$
Space charge neutrality: $p-n+N_{D}^{+}-N_{A}^{-}=0 \quad$ Law of Mass Action: $n_{0} p_{0}=n_{i}^{2}$
Non-equilibrium carriers: $\quad n=N_{C} e^{\left(F_{N}-E_{C}\right) / k T} \quad p=N_{V} e^{\left(E_{V}-F_{P}\right) / k T} \quad n p=n_{i}^{2} e^{\left(F_{N}-F_{P}\right) / k T}$
Conductivity/resistivity: $\sigma=\sigma_{n}+\sigma_{n}=q\left(n \mu_{n}+p \mu_{p}\right)=1 / \rho$
Drift-diffusion current equations: $\quad J_{n}=n q \mu_{n} \varepsilon_{x}+q D_{n} \frac{d n}{d x}=n \mu_{n} \frac{d F_{n}}{d x} \quad \frac{D_{n}}{\mu_{n}}=\frac{k T}{q}$

$$
J_{p}=p q \mu_{p} \varepsilon_{x}-q D_{p} \frac{d p}{d x}=p \mu_{p} \frac{d F_{p}}{d x} \quad \frac{D_{p}}{\mu_{p}}=\frac{k T}{q}
$$

Carrier conservation equations: $\quad \frac{\partial n}{\partial t}=+\nabla \cdot\left(\frac{J_{n}}{q}\right)+G_{n}-R_{n}$
$\frac{\partial p}{\partial t}=-\nabla \cdot\left(\frac{J_{p}}{q}\right)+G_{p}-R_{p}$
Poisson's equation:
$\nabla \cdot(\epsilon \mathcal{E})=\rho$
SRH carrier recombination: $\quad R=\Delta n / \tau_{n} \quad$ or $\quad R=\Delta p / \tau_{p}$
Minority carrier diffusion equation: $\frac{\partial \Delta n}{\partial t}=D_{n} \frac{\partial^{2} \Delta n}{\partial x^{2}}-\frac{\Delta n}{\tau_{n}}+G_{L}$

$$
L_{D, n}=\sqrt{D_{n} \tau_{n}}
$$

PN homojunction electrostatics:

$$
V_{b i}=\frac{k T}{q} \ln \left(\frac{N_{D} N_{A}}{n_{i}^{2}}\right) \quad \frac{d \varepsilon}{d x}=\frac{\rho(x)}{K_{s} \epsilon_{o}}
$$

$W=\sqrt{\frac{2 K_{s} \epsilon_{o} V_{b i}}{q}\left(\frac{N_{A}+N_{D}}{N_{A} N_{D}}\right)} \quad x_{n}=\left(\frac{N_{A}}{N_{A}+N_{D}}\right) W \quad x_{p}=\left(\frac{N_{D}}{N_{A}+N_{D}}\right) W \quad \varepsilon(0)=\sqrt{\frac{2 q V_{b i}}{K_{s} \epsilon_{o}}\left(\frac{N_{A} N_{D}}{N_{A}+N_{D}}\right)}$

PN diode current: $\quad \Delta n(0)=\frac{n_{i}^{2}}{N_{A}}\left(e^{q V_{A} / k T}-1\right) \quad \Delta p(0)=\frac{n_{i}^{2}}{N_{D}}\left(e^{q V_{A} / k T}-1\right)$
$J_{D}=J_{o}\left(e^{q V_{A} / k T}-1\right) \quad J_{o}=q\left(\frac{D_{n}}{L_{n}} \frac{n_{i}^{2}}{N_{A}}+\frac{D_{p}}{L_{p}} \frac{n_{i}^{2}}{N_{D}}\right)$ (long) $\quad J_{o}=q\left(\frac{D_{n}}{W_{p}} \frac{n_{i}^{2}}{N_{A}}+\frac{D_{p}}{W_{n}} \frac{n_{i}^{2}}{N_{D}}\right)$ (short)
Non-ideal diodes: $\quad I=I_{o}\left(e^{q\left(V_{A}-I R_{s}\right) / k T}-1\right) \quad J_{g e n}=-q \frac{n_{i}}{2 \tau_{o}} W$
Photovoltaics: $\quad V_{o c}=\frac{n k T}{q} \ln \left(\frac{J_{s c}}{J_{o}}\right) \quad J_{P V}=J_{o}\left(e^{q V_{A} / k T}-1\right)-J_{s c}$
Small signal model: $\quad G_{d}=\frac{I_{D}+I_{o}}{k T / q} \quad C_{J}\left(V_{R}\right)=\frac{K_{s} \epsilon_{o} A}{\sqrt{\frac{2 K_{s} \sigma_{G} V_{b i}}{q N_{A}}}}=A \sqrt{\frac{q K_{s} \epsilon_{0} N_{A}}{2 V_{b i}}} \quad C_{D}=G_{d} \tau_{n}$

MS diode properties: $q V_{b i}=\left|\Phi_{M}-\Phi_{S}\right| \quad \Phi_{B P}=\chi+E_{G}-\Phi_{M} \quad \Phi_{B N}=\Phi_{M}-\chi$ $J_{D}=J_{o}\left(e^{q V_{A} / k T}-1\right) \quad J_{o}=A^{*} T^{2} e^{-\Phi_{B} / k T} \quad A^{*}=\frac{4 \pi q m^{*} k_{B}^{2}}{h^{3}}=120 \frac{m^{*}}{m_{o}} \frac{\mathrm{~A}}{\mathrm{~cm}^{2} \cdot \mathrm{~K}^{2}}$

MOS capacitors: $\quad W=\sqrt{\frac{2 K_{s} \epsilon_{o} \phi_{S}}{q N_{A}}} \quad \varepsilon_{S}=\sqrt{\frac{2 q N_{A} \phi_{s}}{K_{s} \epsilon_{o}}} \quad$ (for p-type substrates)

$$
\begin{gathered}
Q_{B}=-q N_{A} W\left(\phi_{s}\right)=-\sqrt{2 q K_{s} \epsilon_{o} N_{A} \phi_{s}} \frac{\mathrm{C}}{\mathrm{~cm}^{2}} \\
V_{G}=V_{F B}+\phi_{s}+\Delta \phi_{o x}=V_{F B}+\phi_{s}-\frac{Q_{s}\left(\phi_{s}\right)}{C_{o x}} \\
C_{o x}=K_{o} \epsilon_{o} / x_{o} \quad V_{F B}=\Phi_{m s} / q-Q_{F} / C_{o x}
\end{gathered}
$$

$C=C_{o x} /\left[1+\frac{K_{o} W\left(\phi_{s}\right)}{K_{s} x_{o}}\right]$

$$
V_{T}=-Q_{B}\left(2 \phi_{F}\right) / C_{o x}+2 \phi_{F}
$$

$$
Q_{n}=-C_{o x}\left(V_{G}-V_{T}\right)
$$

MOSFETs:

$$
I_{D}=-W Q_{n}(y=0)\left\langle v_{y}(y=0)\right\rangle
$$

$$
I_{D}=\frac{W}{L} \mu_{n} C_{o x}\left(V_{G S}-V_{T}\right) V_{D S} \quad I_{D}=W C_{o x} v_{s a t}\left(V_{G S}-V_{T}\right)
$$

Square Law (for $V_{G S} \geq V_{T}$ ): $\quad I_{D}=\left\{\begin{array}{lr}\frac{W}{L} \mu_{n} C_{o x}\left[\left(V_{G S}-V_{T}\right) V_{D S}-V_{D S}^{2} / 2\right], & 0 \leq V_{D S} \leq V_{G S}-V_{T} \\ \frac{W}{2 L} \mu_{n} C_{o x}\left(V_{G S}-V_{T}\right)^{2}, & V_{D S} \geq V_{G S}-V_{T}\end{array}\right.$
