ECE 305 Exam 6 Spring 2015
May 7, 2015

Mark Lundstrom
Purdue University

This is a closed book exam. You may use a calculator and the formula sheet at the end of this exam. Following the ECE policy, the calculator **must** be a Texas Instruments TI-30X IIS scientific calculator.

There are three equally weighted questions. To receive full credit, you must **show your work**.

The exam is designed to be taken in 50 minutes – just like Exams 1-5, but you will have the entire 2 hours to complete it.

Be sure to fill in your name and Purdue student ID at the top of the page.

DO NOT open the exam until told to do so, and stop working immediately when time is called.

The last page is an equation sheet, which you may remove, if you want.

75 points possible, 10 per question

1) 25 points (5 point per part)

2) 25 points (5 points per part)

3) 25 points (5 points per part)

------------------------ Course policy ------------------------

I understand that if I am caught cheating in this course, I will earn an F for the course and be reported to the Dean of Students.

Answer the **multiple choice questions** below by **circling** the **one, best answer**.

1a) Which of the following would reduce “base width modulation” (i.e. the Early effect) and, therefore, increase the output resistance?

a) Increasing the emitter doping.
b) Increasing the collector doping.
c) Increasing the base width.
d) Increase the emitter thickness.
e) Decrease the base doping.

1b) If the emitter injection efficiency is 0.97, what is beta? (Assume active region of operation and a base transport factor of one.)

a) 0.97.
b) 0.03.
c) 32.
d) 323.
e) 97.

1c) What is the order of highest doping density, next highest, and lowest doping density in a conventional BJT?

a) Emitter, base, collector.
b) Emitter, collector, base
c) Base, emitter, collector.
d) Base, collector, emitter.
e) Collector, base, emitter.

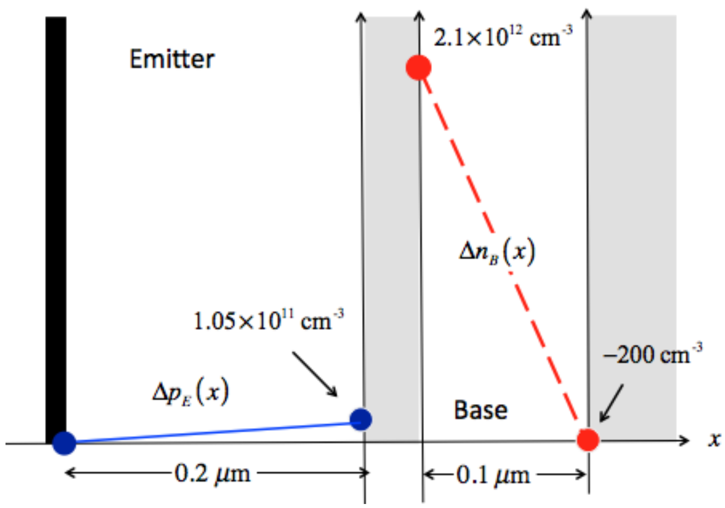
1d) How are the PN junctions biased in the saturation region of a PNP BJT?

a) Emitter-base: forward-biased, Base-collector: forward-biased.
b) Emitter-base: forward-biased, Base-collector: reverse-biased.
c) Emitter-base: reverse-biased, Base-collector: forward-biased.
d) Emitter-base: reverse-biased, Base-collector: reverse-biased.
e) Emitter-base: reverse-biased, Base-collector: zero-biased.

1e) If the emitter injection efficiency is 1.00 and the base transport factor is 0.98, the collector current is $100\ \mu\text{A}$, what is the base current? (Assume active region of operation.)

a) $1\ \mu\text{A}$.
b) $2\ \mu\text{A}$.
c) $3\ \mu\text{A}$.
d) $4\ \mu\text{A}$.
e) $5\ \mu\text{A}$.

2) The figure below is a sketch of the excess minority carrier concentrations in the quasi-neutral emitter and base regions of a bipolar transistor. The shaded areas are the depletion regions and the black rectangle is the emitter contact. You may ignore recombination and assume a transistor area of $10\ \mu\text{m} \times 10\ \mu\text{m} = 100 \times 10^{-8}\ \text{cm}^2$. The diffusion coefficient for electrons is $D_n = 10\ \text{cm}^2/\text{s}$ and for holes, $D_p = 2\ \text{cm}^2/\text{s}$. The temperature is 300 K ($k_B T/q = 0.026$ V).



Answer the following questions.

2a) What region of operation is this transistor biased in? Explain your answer.

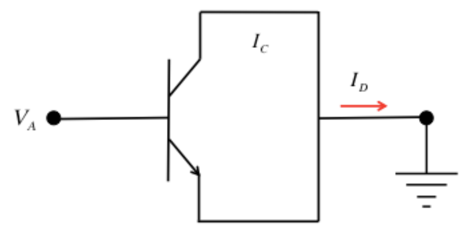
2b) What is the collector current in Amperes for this transistor?

2c) What is the base current in Amperes for this transistor?

2d) What is the emitter injection efficiency of this BJT?

2e) What is the ratio of the emitter doping density to the base doping density? i.e.: $\frac{N_{DE}}{N_{AB}} = ?$

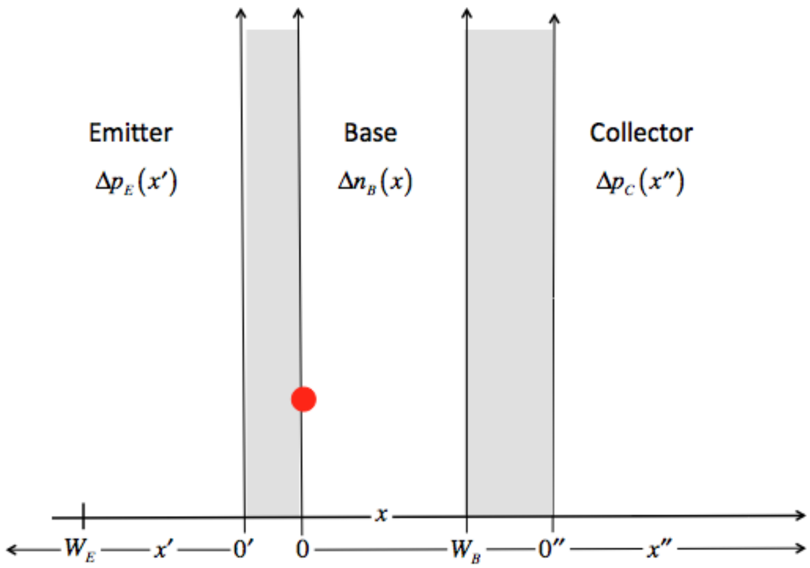
3) This problem is about the transistor show below.



3a) What is the region of operation for this transistor if $V_A > 0$? Explain your answer.

3b) Use the Ebers-Moll equations to derive an expression for $I_D(V_A)$.

The next three parts of question 3 are about the same transistor biased as shown in the figure above, but this time you are asked to plot some internal quantities. Assume that the emitter and base regions are "short" and that the collector is "long" and that $N_{DE} = 4\times10^{18}$ cm^{-3}, $N_{AB} = 2\times10^{18}$ cm^{-3}, and $N_{DC} = 4\times10^{17}$ cm^{-3}. Assume Si at room temperature (300 K and $k_BT/q = 0.026$ V) and that $V_A = 0.7$ V. Your answers to questions 3c), 3d), and 3e) should be plotted on the figure below.



3c) The concentration of excess minority carrier electrons at the beginning of the base, $\Delta n_B(0)$, is indicated by the filled circle on the figure above. Determine numerical values of the excess minority electron density at the two ends of the base, $\Delta n_B(0)$ and $\Delta n_B(W_B)$ and sketch $\Delta n_B(x)$ within the base.

Numerical values of:
$\Delta n_B(0) = ?$ cm^{-3}
$\Delta n_B(W_B)?$ cm^{-3}

Also, plot $\Delta n_B(x)$ on the figure above. **(Make it clear whether your plot is linear or curved.)**

3d) Find the concentration of excess minority carrier holes, $\Delta p_E(0')$ at the beginning of the emitter. You may assume that $\Delta p_E(W_E) = 0$ at the emitter contact, $x' = W_E$. Determine the numerical value of $\Delta p_E(0')$ and plot $\Delta p_E(x')$ in the emitter. Be sure that the scale is consistent with the minority electron profile in the base.

Numerical value of:
$\Delta p_E(0') = ?\ \text{cm}^{-3}$

Also, plot $\Delta p_E(x')$ on the figure above. **(Make it clear whether your plot is linear or curved.)**

3e) Find the concentration of excess minority carrier holes, $\Delta p_C(0'')$ at the beginning of the collector. Determine the numerical value of $\Delta p_C(0'')$ and plot $\Delta p_C(x'')$ in the collector. Be sure that the scale is consistent with the minority electron profile in the base.

Numerical value of:
$\Delta p_C(0'') = ?\ \text{cm}^{-3}$

Also, plot $\Delta p_C(x'')$ on the figure above. **(Make it clear whether your plot is linear or curved.)**
