Frequency Modulated AFM

Ron Reifenberger  
Birck Nanotechnology Center  
Purdue University

# Scanning Probe Microscopy

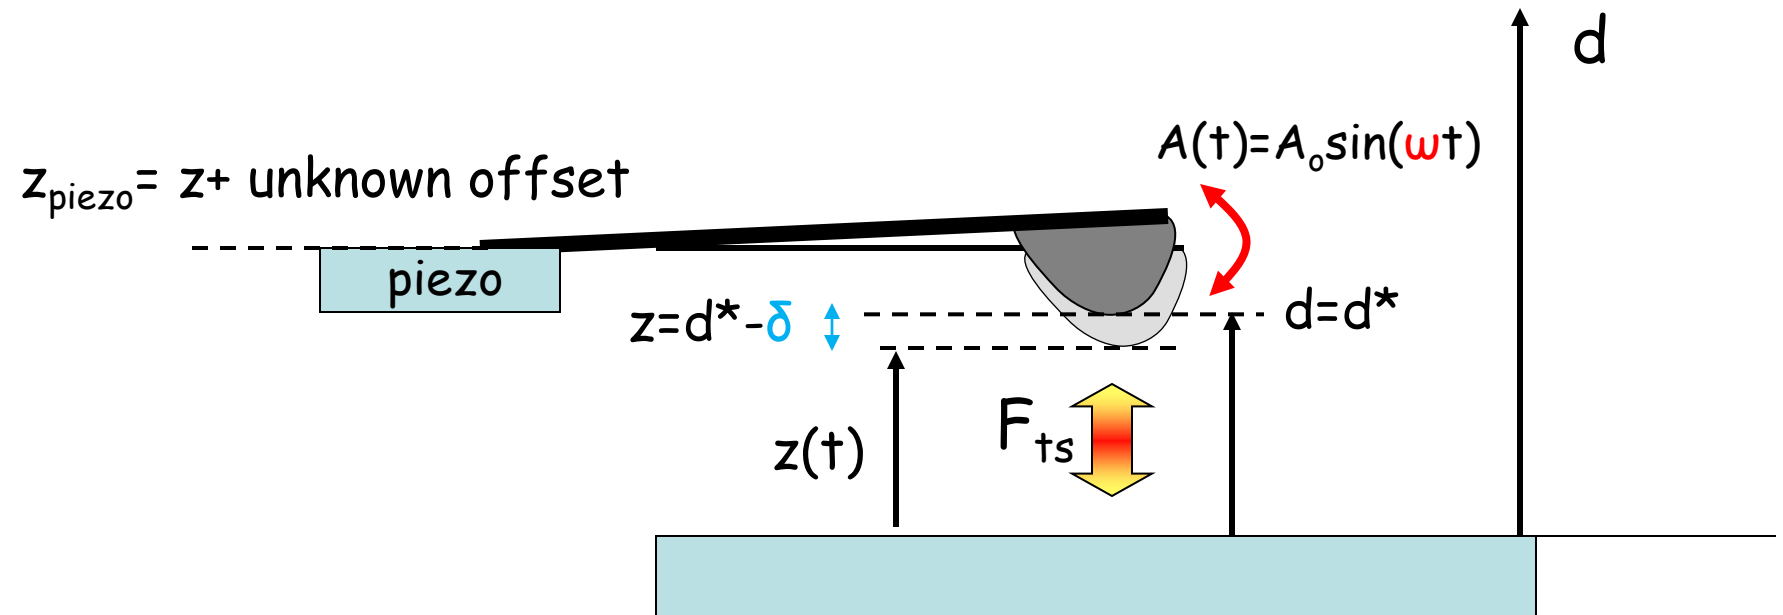

Note: FM means Frequency Modulation, NOT Force Modulation

# Questions

How to finely control  $F_{ts}(z)$  ?

How to measure  $F_{ts}(z)$  ?

What benefits are gained?

**Answer:** Focus on the frequency, not the amplitude!

# Oscillations in quadratic potential well (no energy loss)

2 clicks

# How much energy is stored?

1 eV/atom = 23 kcal/mole = 96 kJ/mole

# The Simple Harmonic Oscillator (SHO) is really simple!

## Equation of Motion

$$\text{Let } V(z) = \frac{1}{2} k_1 z^2$$

$$F \equiv -\partial V(z) / \partial z = ma$$

$$\Rightarrow m \frac{d^2}{dt^2} z + k_1 z = 0$$

$$f = \frac{1}{2\pi} \sqrt{\frac{k_1}{m}}$$

$$T \equiv \frac{1}{f} = 2\pi \sqrt{\frac{m}{k_1}}$$

# Conservation of Energy

$$E_{tot} = \frac{1}{2} m \left( \frac{dz}{dt} \right)^2 + V(z)$$

$$\frac{dz}{dt} = \sqrt{\frac{2E_{tot}}{m} - V(z)}$$

$$\int dt = \int \frac{dz}{\sqrt{\frac{2E_{tot}}{m} - V(z)}} \quad (1)$$

$$\int_0^{T/4} dt = \int_0^{z_{max}} \frac{dz}{\sqrt{\frac{2E_{tot}}{m} - \frac{1}{2} k_1 z^2}}$$

$$\frac{T}{4} = \sqrt{\frac{m}{k_1}} \sin^{-1} \left( z \sqrt{\frac{k_1}{2E_{tot}}} \right) \Big|_0^{z_{max}} = \sqrt{\frac{m}{k_1}} \frac{\pi}{2}$$

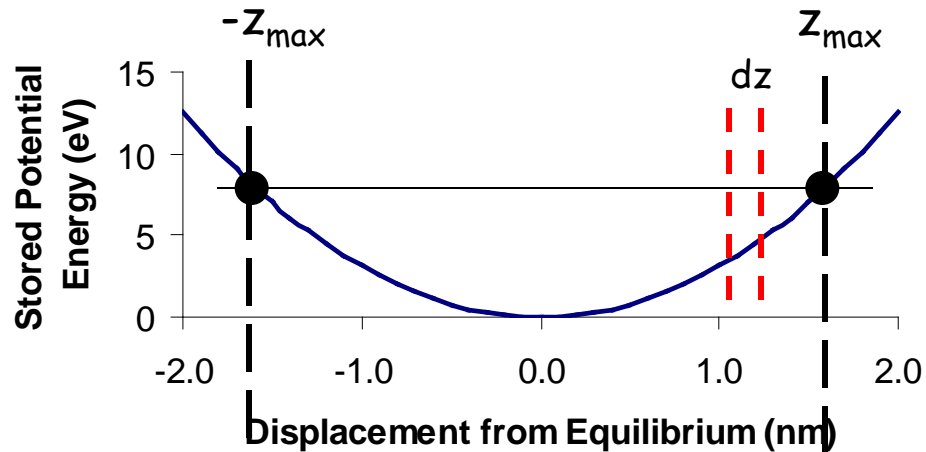

$$T = 2\pi \sqrt{\frac{m}{k_1}} \Rightarrow f = \frac{1}{2\pi} \sqrt{\frac{k_1}{m}}$$

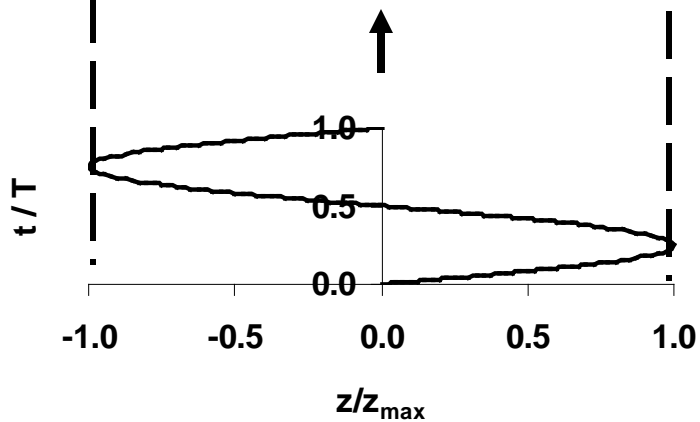

**Isochronous!**

# Numerical Example

## Quadratic Potential

## SHO

## SHO

# I. Oscillations in quadratic potential well with damping

1 click

loss mechanism?

# Equation of Motion for Damped Oscillator

$$V(z) = \frac{1}{2} k_1 z^2$$

$$F \equiv -\partial V(z) / \partial z = ma \quad \Rightarrow$$

$$m \frac{d^2}{dt^2} z + c\dot{z} + k_1 z = 0$$

$$f = \frac{1}{2\pi} \sqrt{\frac{k_1}{m}} \sqrt{1 - \frac{c^2}{4k_1 m}}$$

## II. Non-linear symmetric oscillator; no damping [ $V(z)=V(-z)$ ]

$$V(z) = \frac{1}{2}k_1z^2 + \frac{1}{4}k_3z^4$$

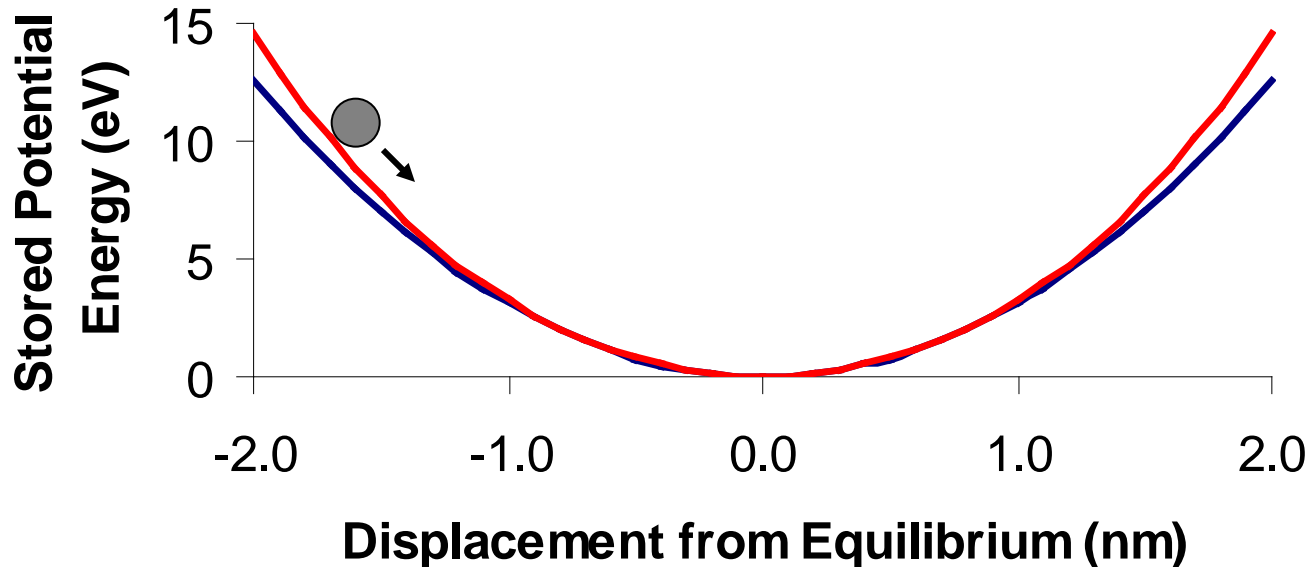

$$F \equiv -\partial V / \partial z = -k_1z - k_3z^3$$

$$k_1 = 1.0 \text{ N/m}$$

$$k_3 = 8 \times 10^{16} \text{ N/m}^3$$

### Symmetric Potential

"hard" spring

# Non-linear Symmetric Oscillator

$$V(z) = \frac{1}{2}k_1 z^2 + \frac{1}{4}k_3 z^4 + \dots$$

$$m \frac{d^2}{dt^2} z + k_1 z + k_3 z^3 + \dots = 0$$

$$z(t) = a_0 + \sum_{n=1}^{\infty} (a_n \sin n\omega t + b_n \cos n\omega t)$$

$a_0 = 0$ ;  $a_n = 0$ ;  $b_2 = b_4 = b_6 = \dots = 0$  from symmetry

Leading non-zero term is  $b_1$

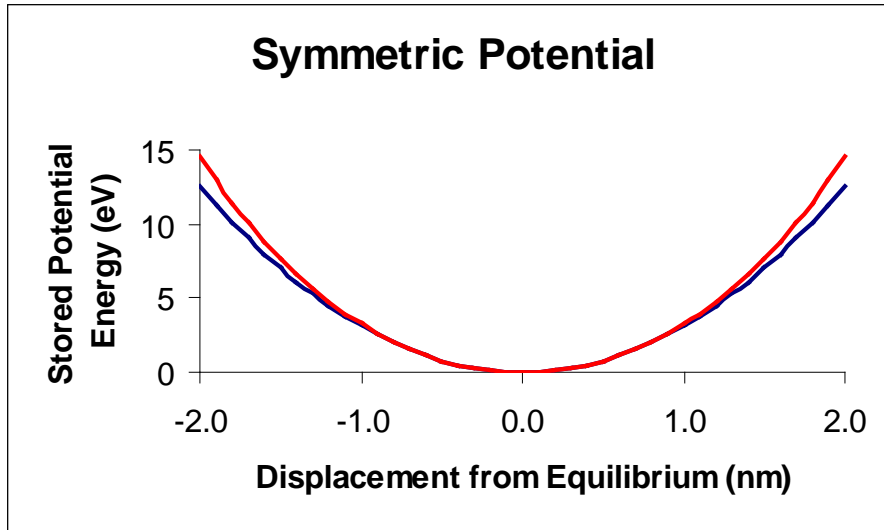

$$f \approx \frac{1}{2\pi} \sqrt{\frac{k_1}{m} + \frac{3}{4} \frac{k_3}{m} b_1^2 + \frac{3}{128} \frac{k_3}{m} \frac{k_3}{k_1} b_1^4 + \dots} = f_0 + \Delta f(b_1)$$

- New feature: frequency depends on amplitude

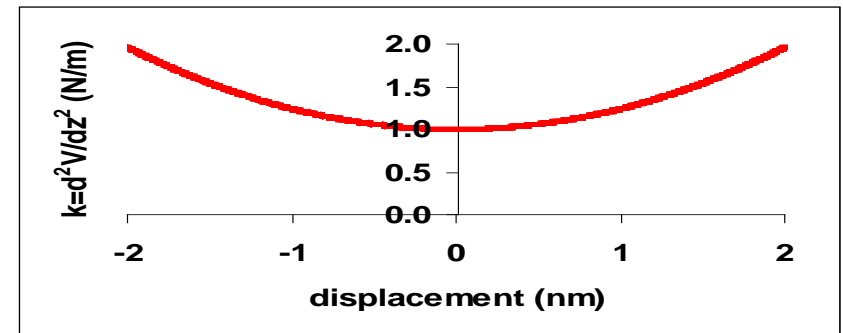

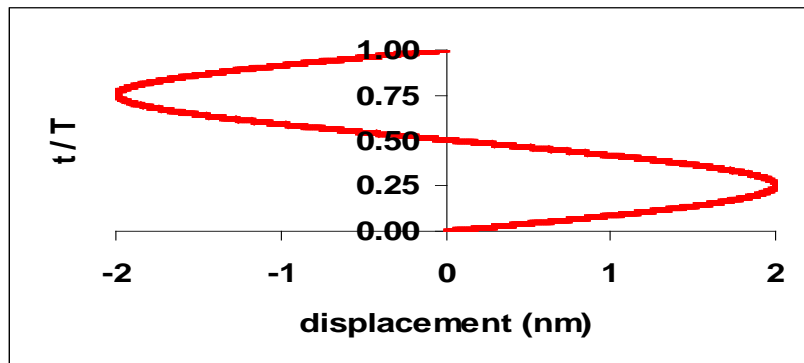

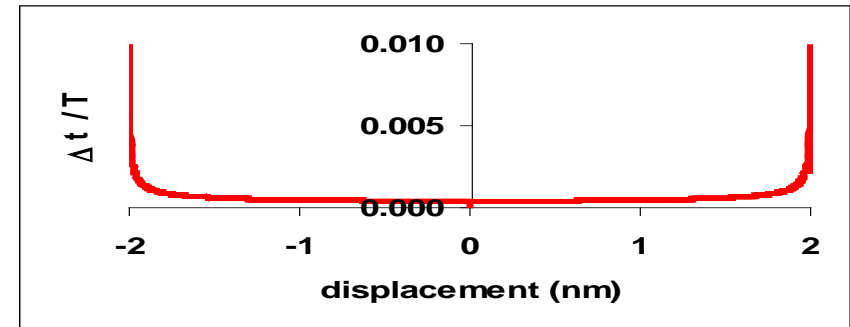

# Non-linear Symmetric Oscillator no Damping

# Non-linear Symmetric Oscillator no Damping

$$V(z) = \frac{1}{2}k_1z^2 + \frac{1}{4}k_3z^4$$

What is the effective spring constant?

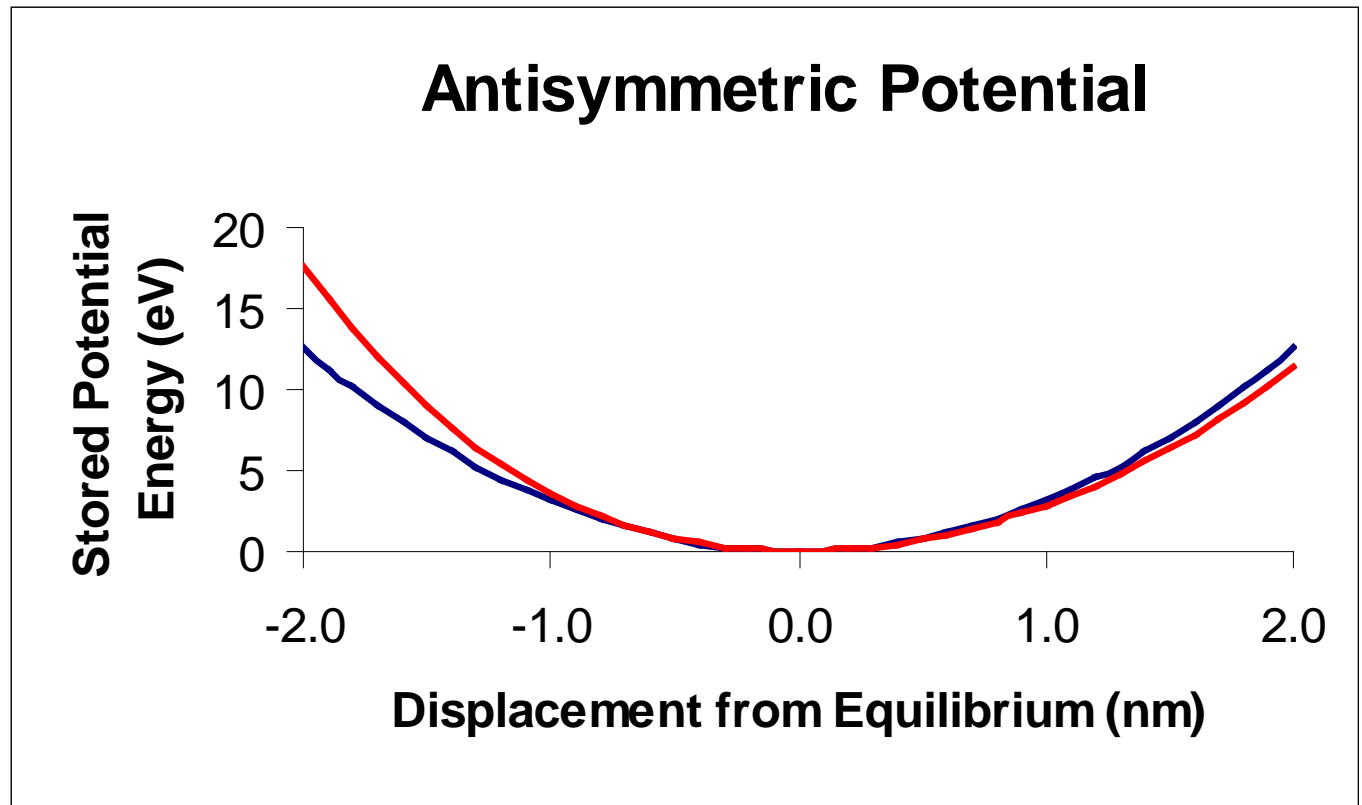

### III. Non-linear antisymmetric oscillator; no damping

$$V(z) = \frac{1}{2}k_1z^2 - \frac{1}{3}k_2z^3 + \frac{1}{4}k_3z^4$$

$k_1 = 1.0 \text{ N/m}$

$k_2 = 1.9\text{E}8 \text{ N/m}^2$

$k_3 = 8\text{E}16 \text{ N/m}^3$

# Non-linear Antisymmetric Oscillator

$$V(z) = \frac{1}{2}k_1 z^2 - \frac{1}{3}k_2 z^3 + \frac{1}{4}k_3 z^4 + \dots$$

$$m \frac{d^2}{dt^2} z + k_1 z - k_2 z^2 + k_3 z^3 + \dots = 0$$

$$z(t) = a_0 + \sum_{n=1}^{\infty} (a_n \sin n\omega t + b_n \cos n\omega t)$$

$a_n = 0$ ; solution now contains BOTH even and odd harmonics<sup>†</sup>

$$f \approx \frac{1}{2\pi} \sqrt{\frac{k_1}{m} + \frac{3k_3}{4m} b_1^2 - \frac{5k_2}{6m} \frac{k_2}{k_1} b_1^2 + \dots}$$

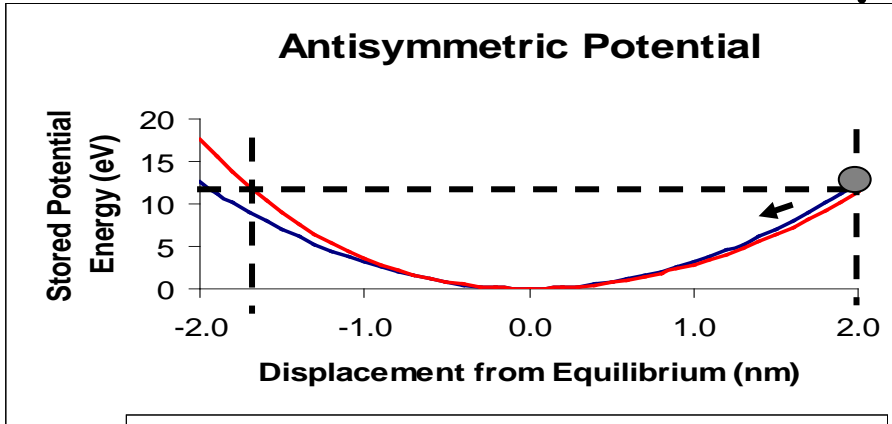

- frequency depends on amplitude
- integer harmonics appear

# Non-linear Antisymmetric Oscillator

# Non-linear Antisymmetric Oscillator

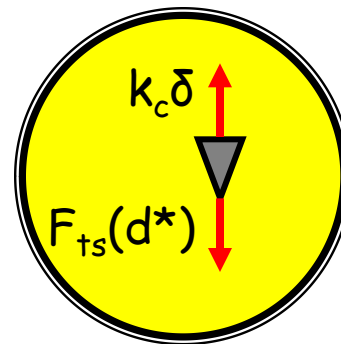

$$V(z) = \frac{1}{2}k_1z^2 - \frac{1}{3}k_2z^3 + \frac{1}{4}k_3z^4$$

effective spring constant:  
weighted average

# IV: The Oscillating AFM Tip

Static Free-body diagram

How does frequency change as  $d^*$  decreases?

The tip-substrate spring is a different type of spring!

## "Conventional" Spring

$$m\ddot{z} = -k_1z - k_2z$$

$$\omega = \sqrt{\frac{k_1 + k_2}{m}}$$

## Tip-Substrate "Effective" Spring

$$m\ddot{z} = -k_c z + k_{ts} z \quad \text{or}$$

$$m\ddot{z} = -(k_c - k_{ts})z$$

$$\omega = \sqrt{\frac{k_c - k_{ts}}{m}} = \sqrt{\frac{k_c}{m} \left(1 - \frac{k_{ts}}{k_c}\right)}$$

$$\square \omega_o \left(1 - \frac{1}{2} \frac{k_{ts}}{k_c} + \dots\right); \quad \omega_o \equiv \sqrt{\frac{k_c}{m}}$$

# What's the frequency shift?

for small Amplitude of oscillation

$$\omega \approx \omega_o \left( 1 - \frac{1}{2} \frac{k_{ts}}{k_c} + \dots \right)$$

Frequency shift is  $\rightarrow$  negative

$$\omega - \omega_o \equiv \Delta\omega(d^*) \approx -\frac{\omega_o}{2k_c} k_{ts} \Big|_{d^*} = -\frac{\omega_o}{2k_c} \frac{dF_{ts}(d^*)}{dz}$$

$$d^* = z - \delta$$

$$\Rightarrow F_{ts}(d^*) = -2k_c \int_{\infty}^{d^*} \frac{\Delta\omega}{\omega_o} dz$$

# Putting in some numbers

$$\text{if } F_{ts} = -\frac{HR}{6(z)^2}$$

$$\text{and } k_{ts} = \left. \frac{dF_{ts}}{dz} \right|_{z=d^*} = \frac{HR}{3(d^*)^3}$$

$$\therefore \frac{\Delta\omega}{\omega_o} = -\frac{1}{2k_c} \frac{dF_{ts}}{dz} = -\frac{1}{2k_c} \frac{HR}{3(d^*)^3}$$

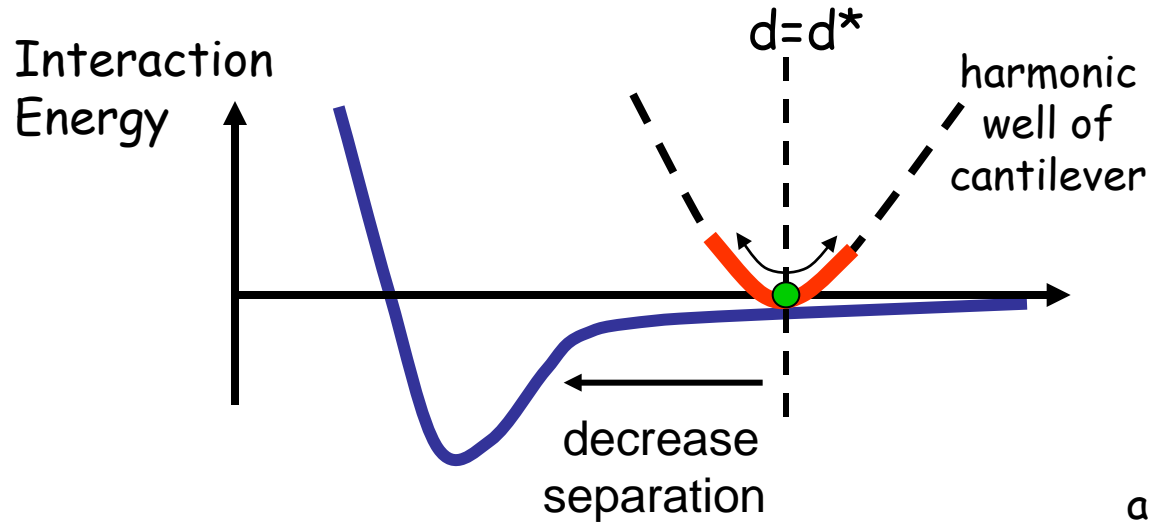

$k_c=40 \text{ N/m}; R=10 \text{ nm}$

# Probing the Interaction Potential (schematic)

## A. Small amplitude

## B. Large amplitude

# vdW + DMT for $d=d^*=0.8$ nm

Input Parameters:

$$k = 5 \text{ N/m}$$

$$a_0 = 0.3 \text{ nm}$$

$$H = 4 \times 10^{-20} \text{ J}$$

$$R = 10 \text{ nm}$$

$$E^* = 20 \text{ GPa}$$

# How to determine $F_{ts}(z)$ from $\Delta f(z)$ for arbitrary amplitude of oscillation?

APPLIED PHYSICS LETTERS
