Introduction

- The quantum dot lab is a tool that solves the Schrödinger equation for an electron in a quantum dot.
- The quantum dot lab yields the wavefunction, the electron energy levels, and the optical transition rates/absorption strength of an electron.

A detailed introduction to the quantum dot lab also can be found at <https://www.nanohub.org/resources/4194>.

? About this tool
Questions?

Number of States: 7

Surface passivation: "yes"

Device Structure

Light Source

Geometry: Cuboid

X dimensions: 10nm

Y dimensions: 10nm

Z dimensions: 10nm

Effective Mass: 0.067

Discretization: 0.565nm

Energy gap: 1.43eV

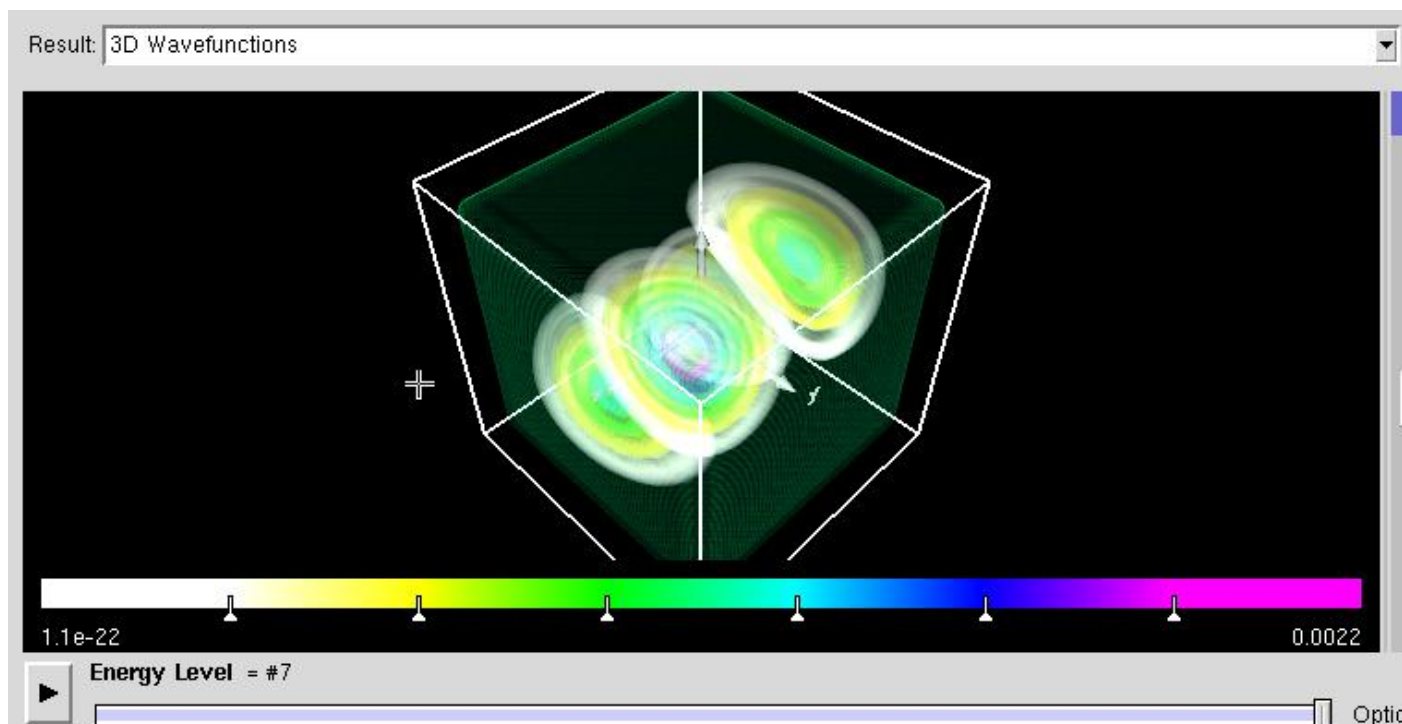

Simulate >

Input Interface

- Number of states
- Device structure
 - » geometry
 - » effective mass/ discretization/ energy gap
- Light source
 - » light polarization
 - » optical parameters
 - » sweep

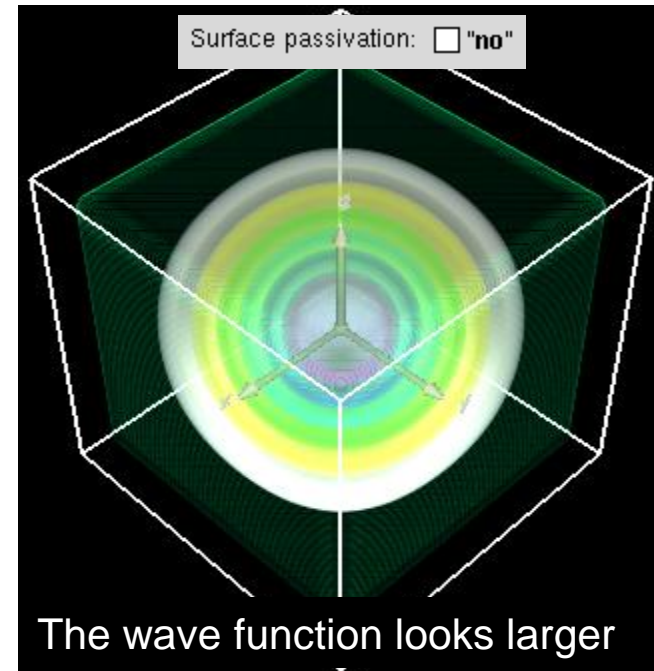

The Number of States

- First, choose the number of states: the default value is “7.” Number of States: 7
- How many states do you want to see in the output?
 - » Do not choose an unnecessarily large number; it increases the run time.
- The output below shows that up to 7 energy levels are viewable, if the number of states chosen in the input is 7.

Surface Passivation

- The “surface passivation” option passivates the surface so that the electron feels an infinite potential barrier at the surface of the quantum dot.
 - » Surface passivation forces the electron wave function at the surface of the quantum dot to go to zero.
 - » If “no” is chosen, then the wavefunction is allowed to leak out of the quantum dot. The result is illustrated in the following figures:

Device Structure: Geometry

- The geometry can be set by choosing x, y, and z dimensions for each of the configurations shown below.

Geometry: 

Cuboid
Cylinder
Dome
Pyramid
Spheroid

X dimensions: **5nm**

Y dimensions: **5.5nm**

Z dimensions: **6nm**

Click to expand

Other Device Structure Parameters

Click to expand

Effective Mass: 0.067

InAs
GaAs
Ge
Si (heavy mass)
Si (light mass)
Free Space

• Effective mass

- » Ratio to the free electron mass (m_0)
- » e.g., 0.067 means $m = 0.067 \times m_0$

Discretization: 0.565nm

InAs
GaAs
Ge
Si

• Discretization

- » The discrete mesh spacing in the quantum dot domain (simple cuboid for all shapes of quantum dot)

Energy gap: 1.43eV

InAs
GaAs
Ge
Si

• Energy gap

- » The energy gap between the valance and the conduction band edge

Light Source: Polarization/Optical Parameters

Light Polarization

Angle theta: **45deg**

Angle phi: **0deg**

Optical Parameters Click to expand

Electron Fermi level: **0eV**

Temperature: **300K**

State broadening: **0.01**

300K (room temperature)

77K (liquid nitrogen)

4.2K (liquid helium)

Sweep

Sweep parameter: Angle theta in units of 'degree'

Minimum: **0**

Maximum: **90**

Number of points: **3**

- The light source shines on the quantum dot to reveal the optical properties.
- Users can choose the angles *theta* (θ) or *phi* (Φ) as shown in the figure to the top left.
- Fermi level (relative to the lowest energy level)
- Temperature (ambient temperature)

For a detailed description, see:
<https://www.nanohub.org/resources/4194>

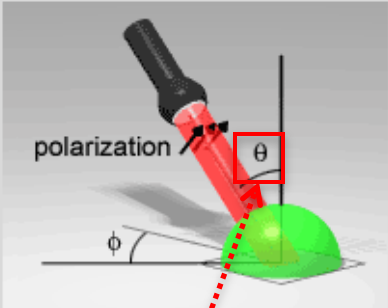

Light Source: State Broadening

- “State broadening” determines:
 - » the broadening width of the energy states in the quantum dot
 - » the width of the Lorentzian shape of the optical absorption

Light Source: Sweep

Light Polarization

Angle theta: **45deg**

Angle phi: **0deg**

Optical Parameters

Electron Fermi level: **0eV**

Temperature: **300K**

State broadening: **0.01**

Sweep

Sweep parameter: **Angle theta** in units of 'degree'

Minimum: **0**

Maximum: **90**

Number of points: **3**

Output Interface

- **3D wavefunctions:** 3D plot of the electron wavefunction in a quantum dot
- **Energy states:** the energy levels of the electron in a quantum dot

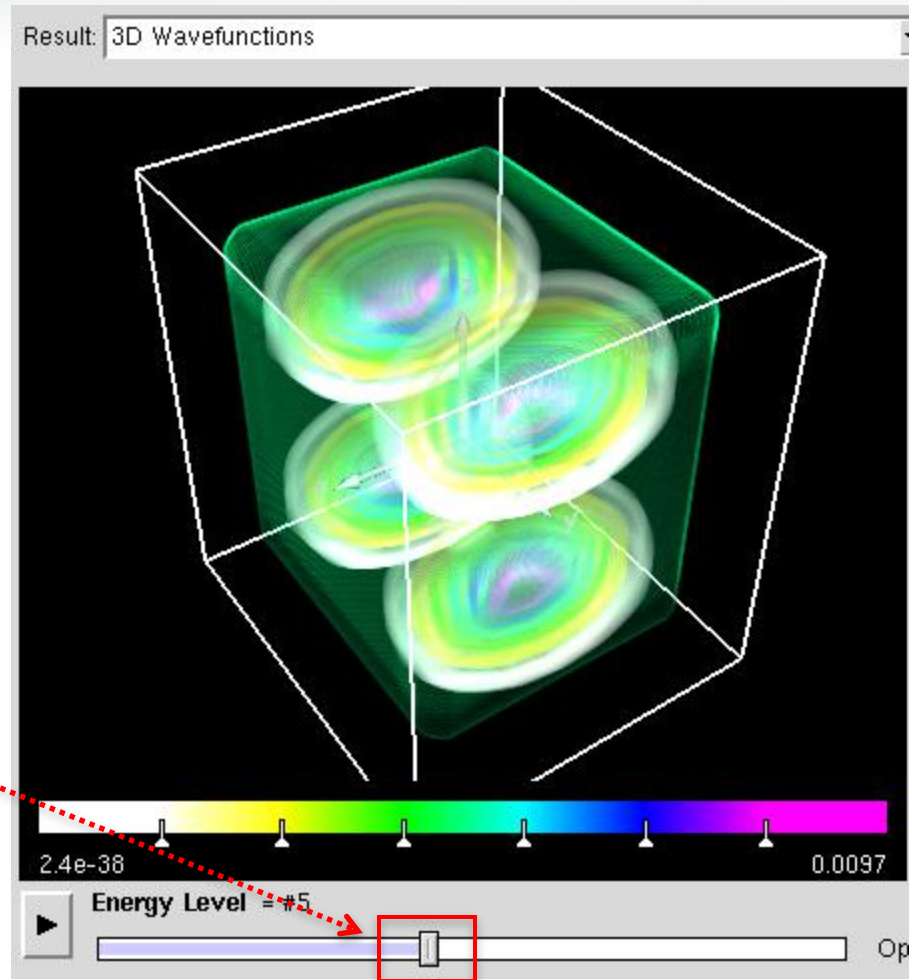

Optical Properties

- **Light and dark transitions:** the transition strength of electrons when the light shines onto a quantum dot
 - » X-polarized: when X-polarized light is shined
 - » Y-polarized: when Y-polarized light is shined
 - » Z-polarized: when Z-polarized light is shined
- **Absorption:** the absorption strength
- **Absorption sweep:** the absorption strength plot when the angles *theta*, *phi*, Fermi level, or temperature is swept.
- **Integrated absorption:** the integrated (the area under the graph of) absorption for each sweeping variable.

Refer to the introductory tutorial for more examples of the optical properties
<https://www.nanohub.org/resources/4194>

3D Wavefunctions

Energy States

States Order	Notations in Qdot Lab
1 st state	Ground state
2 nd state	1 st excited state
3 rd state	2 nd excited state
...	...

Magnified view of the selected portion

Total energy range

Energy range selected

Optical Properties: Transition Strength

Geometry: Cuboid

X dimensions: 5nm

Y dimensions: 5.5nm

Z dimensions: 6nm

From the geometry, expect that the p_z -type orbital has the lowest energy. (Inverse order to the real space dimensions.)

s to p_z orbital transition can be observed by Z-polarized light

The first large transition comes exactly at the transition energy from s to p_z type orbital.

Optical Properties: Absorption

Each point is calculated by integrating each absorption graph (note that the color of each point matches the color of the line in the left figure).

Simulation Engine Behind the Tool: NEMO 5

- Right now, the engine for the quantum dot lab is NEMO 5.
- NEMO 5 is a Nano Electronic MOdeling tool.^[2]
- The quantum dot lab tool mainly uses the following parts of NEMO 5:
 - » structure construction
 - » Schrödinger solver
 - » optical properties solver
