UNIVERSITY

# Theme

Steelmaking in Bethlehem, PA

Computer chip wiring in Silicon Valley

How can traditional (metallurgical) technologies inform nanotechnology, and vice versa?

# Dealloying: A Method to Create Nanoporosity

**Nanoporosity:**  
Ligament widths  
and spacings are of  
order 10 nm

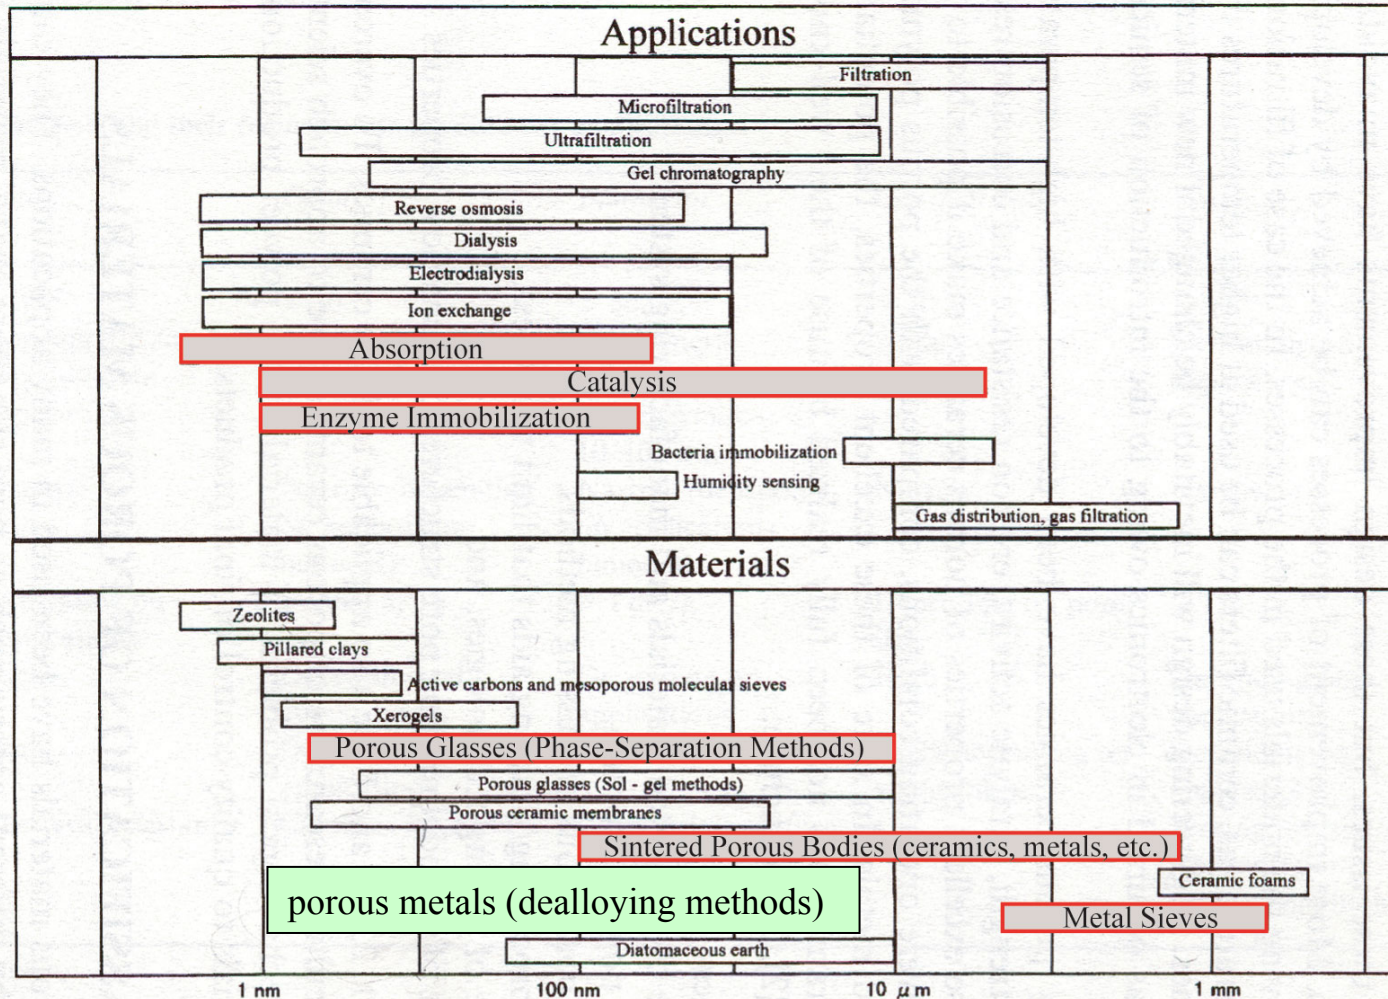

**“Nanoporous Gold” (NPG)**

# History of NPG

- “Depletion gilding” was known to the ancient Incas
- Origin of current interest:  
*Corrosion*
  - Dealloying is seen during corrosion of many technologically important brasses, stainless steels, and Cu-Al alloys

# Modern Context of Nanoporous Metals

from K. Ishizaki, Porous Materials: Process Technology and Applications, (Kluwer), 1998.

# Fuel Cells : An application for nanoporous metals?

Cathode and anode must

- (a) be conductive  
*allows electron flow*
- (b) be porous  
*allows reactant gas flow*
- (c) have a very high surface area catalyst  
*optimizes precious metal use*

# Materials Design of Precious Metal Fuel Cell Catalysts

## Nanoparticles

- High surface area/volume
- Immobilization by physisorption
  - thermal stability issues*
- No intrinsic in-plane conductivity
- Processing leads to “thick” (>10 microns) catalyst layers

## Mesoporous Metal Membranes

- High surface area/volume
- Immobilization by epitaxy
  - thermal stability issues good?*
- High intrinsic in-plane conductivity
  - proton conduction still a problem*
- Processing leads to thin (100 nm) catalyst layers

# Making NPG Films: Thin-Film Fabrication

Minuses → expense

- Requires ultra-high vacuum
- Much of the material that is evaporated is wasted
- Time consuming

Plusses

- Extremely clean ( $< 10^{-10}$  Torr)
- Very small features ( $< 0.1$  micron) with great precision

# Stress Evolution in Volmer-Weber Growth

islanding

coalescence (~100 nm grains)  
system wants to create grain boundaries

**substrate:** compression  
**film:** tension

# Cracking in Dealloyed Silver Gold Thin Films

4,000x

200,000x

# Wouldn't it be nice....?

To have a porous gold film with the following properties:

- Thin ( $< 200$  nm)
- Doesn't crack upon dealloying
- Not attached to a substrate

# Gold Leaf: An Old Technology

<http://shofu.pref.ishikawa.jp>

# Gold Leaf: The Historical Perspective

## Progress of Materials and Materials Processing

1. Stone bashing (> 10,000 years)
2. Fire (> 10,000 years)
3. Melting metal (> 5,000 years)
4. Gold Leaf (bashing + fire + metal) (> 4,000 years)

# Nanoporous Gold “Leaf”

silver/gold leaf, 100 nm thick, 35 at. % Au, 3 3/8” x 3 3/8” : note color change!

# Catalytic Applications of Nanoporous Gold

Cathode and anode must

- (a) be conductive
- (b) be porous
- (c) contain a very high surface area of catalyst both in electrical contact (to the current load), and in ionic contact (to the polymer electrolyte) → thin is good

*Nanoporous gold leaf fits the bill, but is not catalytic itself. But what about Pt-plated NPG....*

# Electroless Plating of NPG Leaf to form Nanocomposites

Take advantage of the fact that leaf floats on water.

Plating should be confined to within the pores, and should self-limit  
-- an advantage over typical electroless or electrochemical plating  
To date, we have plated **Pt**, Ni, Co, and **Ag**

# Pt-Plated Nanoporous Gold Leaf

*In SEM, coatings look nanoparticulate, dense, and conformal.*

# Growth Kinetics of Pt-NPGL

*Deposition may be controlled to within 0.01 mg/cm<sup>2</sup> (1 ml) using only room temperature benchtop chemistry. Deposition stops prior to filling of pores. (?!)*

# HRTEM of Pt-NPGL

Pt

Porous Gold

Particle growth seems to  
“self-limit”

# HRTEM of Pt-NPG

*before*

*after*

Where did all the islands go?

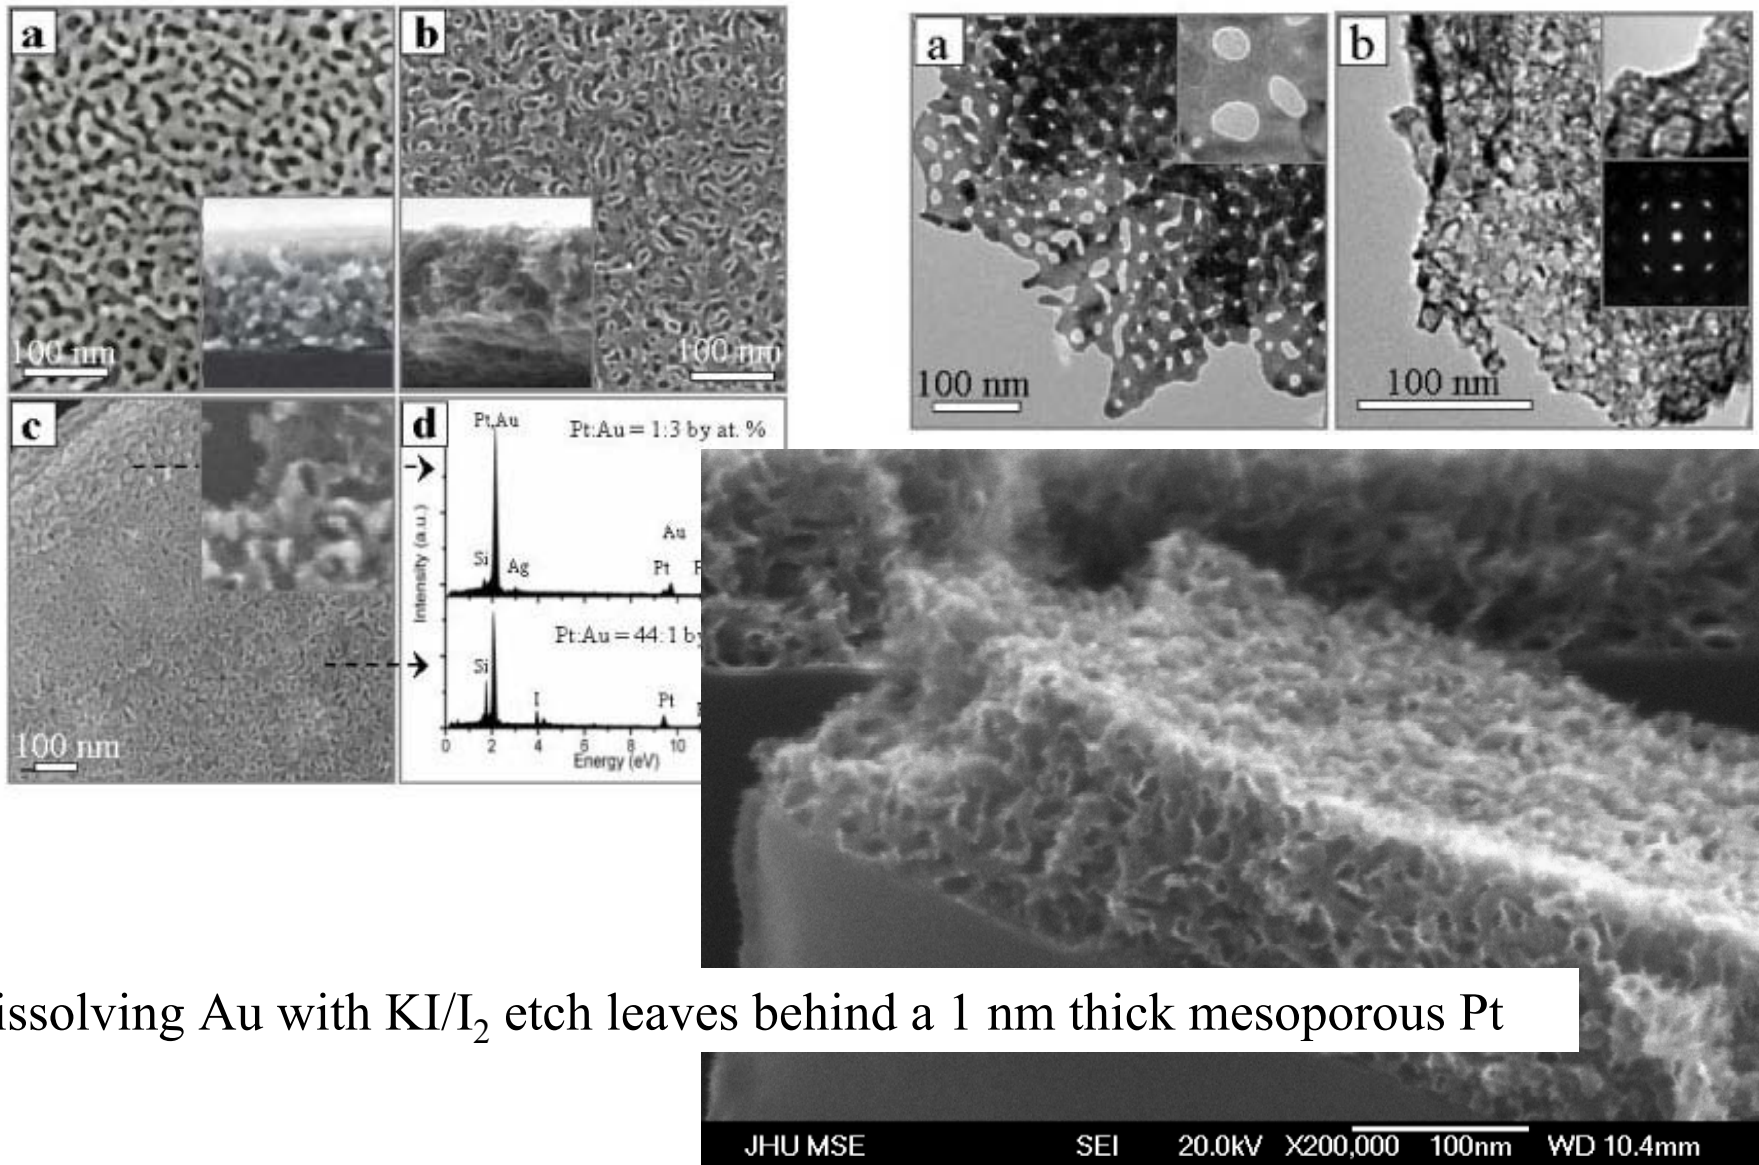

# Formation of an Epitaxial Pt skin on NPG

Dislocations at the Pt/Au interface relieve stress more efficiently than islanding.

*hypothesis – initial SK growth is metastable*

# Nanotubular Mesoporous Pt – A doubly bicontinuous mesoporous metal

dissolving Au with  $KI/I_2$  etch leaves behind a 1 nm thick mesoporous Pt

# Summary

- Nanoporous materials are emerging as an important “nanotechnology”
- Familiarity with traditional materials processing technology is still relevant
- *Nanoporous gold has a bright future!*

Thanks!
