

nanoHUB Account

- This talk's online PhysiCell models are cloud-hosted on nanoHUB.org.
- nanoHUB is **free**, but it requires a one-time registration.

• Steps:

1. Visit <https://nanohub.org/register>
2. Choose "Sign in with Google"
3. Choose a Google account
4. Click "No" (so it doesn't try to associate with some other nanoHIB account)
5. Finish filling in details, and you're done!
6. Use your google account to sign in in the future.

MathCancer.org

Also thank you to sponsors

- This work is supported by:
 - **National Cancer Institute & Breast Cancer Research Foundation:**
 - ◆ Simulation methods were originally developed for cancer.
 - **National Science Foundation:**
 - ◆ Helped us automatically share complex simulation models on the cloud.
 - **Jayne Koskinas Ted Giovanis Foundation for Health and Policy**
 - ◆ A large emergency grant to jump-start a COVID-19 modeling coalition.
 - ◆ Funding for breast cancer research (jointly with Johns Hopkins and others).
 - Generous computing resources at Indiana University

COVID-19 is a multiscale problem

- At the **subcellular level**:

- Viral binding and endocytosis (virus entry)
- Viral replication and exocytosis (virus release)
- ACE2 receptor trafficking
- Signaling responses

- At the **cell level**:

- Infected cells will die, but they can “warn” other cells (interferons)
- Immune cells phagocytose dead cells
- Immune cells attack infected cells

- At the **tissue level**:

- Virus spreads through the tissue
- The infected regions spreads
- Tissue damage spreads
- Immune cells coordinate with secreted factors

- At the **systems level** (a sampling):

- Immune cells send signals to lymphatic system
- Immune response ramps up (immune expansion, antibodies)
- More immune cells arrive at site of infection

Source: [wikimedia.org](https://commons.wikimedia.org/wiki/File:Life_Cycle_of_SARS-CoV-2.png)

Source DOI: [10.1038/s41418-020-0530-3](https://doi.org/10.1038/s41418-020-0530-3)

This is a complex system.

We want to use mathematical modeling to understand this system and find better treatments.

Collaborative, Iterative Progress

Approach

- **Rapid prototyping**
 - Build, test, and refine
- **Multidisciplinary team**
 - Domain experts guide modelers
 - Subteams work in parallel
 - Integration team coordinates the work
- **Rapid communication**
 - Preprints (open science)
 - Cloud-hosted models for live demos to team experts
- **Open source** software

Progress

Phase I (community building)

- **v1 prototype** (March 2020) built in 12 hours
- **v2 model** (April) added ACE2 receptor trafficking

Phase II (community-driven) (current)

- **v3 model** (May-July) added tissue immune responses
- **v4 model** (August-October) is adding interferon signaling • pyroptosis • systems-scale immune model • immune cell trafficking • improved tissue immune model • better receptor-virus binding • better viral replication • tissue fibrosis.

Agent-based models

- Simulate the **chemical microenvironment** of a tissue:
 - Movement of unbound virus particles
 - Diffusing signaling factors
 - Dead cell debris
- Simulate **individual cells** as software agents:
 - Individual states (member data)
 - Individual biological actions (divide, die, grow, move, secrete signals)
- Biological hypotheses become **agent rules**
 - Example:
 - ♦ Macrophages migrate randomly until they find and eat a dead cell.
 - ♦ Macrophages “activate” after eating a dead infected cell to recruit CD8 T cells
 - ♦ CD8 T cells seek and attack live infected cells.
- The cell agents are **multiscale** models. Each lung cell simulates:
 - ACE2 receptor binding and “trafficking”
 - Viral replication
 - Response to viral infection & signals (including behavioral changes)
 - Response to drugs (e.g., antivirals)

Current time: 14 days, 0 hours, and 3.00 minutes
111479 agents

Sample PhysCell model:
T cells attacking a tumor

2019 PLoS
Computational Biology

pcISA: an adversarial multicellular system

- What are the dynamics of an adversarial system?
- **suppliers (e.g., blood vessels)**
 - supply growth substrates
- **Invaders (e.g., bacteria)**
 - grow near vessels
 - avoid dead cells
 - avoid attackers
- **Scouts (e.g., macrophages)**
 - look for invaders, release signal
- **Attackers (e.g., T cells)**
 - Look for signal, attack invaders

Try this model yourself!

<https://nanohub.org/tools/pcisa>

pcISA exercises

1. Suppliers and invaders only

- Set # of scouts and # of attackers to 0
- Set max time to 2400 minutes.
- Click run. What happens?
- Plot the resource. How does this explain the behavior?

2. Add scouts

- Set # of scouts to 10
- Click run. What happens? Does plotting the "signal" help explain their behavior?

3. Add attackers (full model)

- Set # of attackers to 50
- Set max time to 7200 minutes.
- Click run. What happens?

4. Modify invaders

- Set invader quorum weight to 0.01
- Click run. What happens?
- Plot the death signal. How does this explain the behavior of invaders after an attack?

5. Modify invaders and scouts (on your own)

- Set invader quorum weight to 1
- Set scout migration bias to 1
- Increase invader max death rate to 0.01
- Click run. What happens?

Iterative modeling progress

v1: Proof of concept model

- **Agents:**

- lung epithelium

in each cell

$$\begin{aligned} \frac{dV}{dt} &= -r_U V + \{ \text{uptake from PDE} \} \\ \frac{dU}{dt} &= r_U V - r_P U \\ \frac{dR}{dt} &= r_P U \\ \frac{dP}{dt} &= r_S R - r_A P \\ \frac{dA}{dt} &= r_A P - \{ \text{export to PDE} \} \end{aligned}$$

- **Submodels:**

- Viral replication
 - ◆ system of 5 ODEs
 - ◆ constitutive relations to connect with virus PDE

- Cell death response

in each cell

$$r_{death} = r_{max} \frac{A^n}{A_{half}^n + A^n}$$

- ◆ Hill pharmacodynamics function

- **Microenvironment:**

- Virus spread
 - ◆ reaction-diffusion PDE

$$\frac{\partial \rho}{\partial t} = D \nabla^2 \rho + \sum_{cells} \delta(x - x_i) (-U_i \rho + E_i)$$

Current time: 0 days, 0 hours, and 0.00 minutes, z = 0.00 μm
4464 agents

More v1 results

default parameters

"baseline" results

slower virus diffusion

sharper plaque boundaries

apoptotic cells release virions at lysis

little impact on overall dynamics

infected cells less tolerant of viral load

somewhat slowed spread

lower infected cell survival time

much more tissue damage,
but plaque spreads at same speed

Prototype 2

(April 1-May 9, 2020)

LUDDY

SCHOOL OF INFORMATICS, COMPUTING, AND ENGINEERING

Macklin Lab
 @MathCancer
MathCancer.org

v2: Add ACE2 receptor dynamics

- **Agents:**

- lung epithelium

- **Submodels:**

- ACE2 receptor binding & trafficking
 - ◆ mass-matching with virus PDE in virus binding
 - ◆ system of 4 ODEs
- Viral replication
 - ◆ system of 5 ODEs
 - ◆ constitutive relation to connect with ACE2 trafficking
 - ◆ constitutive relation to connect with virus PDE
- Cell death response
 - ◆ Hill pharmacodynamics function

- **Microenvironment:**

- Virus spread
 - ◆ reaction-diffusion PDE

Current time: 0 days, 0 hours, and 0.00 minutes, z = 0.00 μm
4055 agents

More v2 results

MOI-based initialization

better approximation of *in vivo*

slower viral diffusion

slower spread,
sharper interface

fewer ACE2 receptors

less multiple infection,
but faster plaque growth

slower viral exocytosis

significant inhibition of
plaque growth

Prototype 3

(May 10-July 27, 2020)

LUDDY

SCHOOL OF INFORMATICS, COMPUTING, AND ENGINEERING

Macklin Lab
 @MathCancer
MathCancer.org

v3: Add the initial immune response

- **Agents:**

- lung epithelium
- macrophages (magenta when activated)
- neutrophils
- CD8+ T cells

- **Submodels:**

- ACE2 receptor binding & trafficking
 - ◆ mass-matching with virus PDE in virus binding
 - ◆ system of 4 ODEs
- Viral replication
 - ◆ system of 5 ODEs
 - ◆ constitutive relation to connect with ACE2 trafficking
 - ◆ constitutive relation to connect with virus PDE
- Cell death response
 - ◆ Hill pharmacodynamics function
- Immune cell rules
- Immune cell recruitment

- **Microenvironment:**

- Virus spread
- Chemokine secreted by infected cells
- Pro-inflammatory cytokine released by activated macrophages

Current time: 0 days, 0 hours, and 0.00 minutes, z = 0.00 μm
2793 agents

no immune response

Current time: 0 days, 0 hours, and 0.00 minutes, z = 0.00 μm
2843 agents

with immune response

We can explore T cell strategies

Current time: 0 days, 0 hours, and 0.00 minutes, z = 0.00 μm
2843 agents

faster T cell recruitment

Current time: 0 days, 0 hours, and 0.00 minutes, z = 0.00 μm
2843 agents

faster T cell killing

Current time: 0 days, 0 hours, and 0.00 minutes, z = 0.00 μm
2993 agents

resident T cells

LUDDY

SCHOOL OF INFORMATICS, COMPUTING, AND ENGINEERING

Macklin Lab
 @MathCancer
MathCancer.org

multiscale immune model advances

Improved macrophages:

- Macrophages exhaustion & death
- Phenotype changes from CD8+ T cell contact
 - Stop secreting pro-inflammatory cytokine
- Enable phagocytosis of live infected cells

Dendritic cells:

- Resident DCs activated by virus or infected cells
- DCs traffick to lymph node to drive T cell expansion

More T cell types

Epithelial cells present antigens

Systems-scale model of immune activation

systems scale:
Tarunendu Mapper
IUPUI

tissue scale:
Adrienne Jenner
U. Montreal

Fully integrated model (v4)

- Tissue-scale immune activation
- Systems-scale immune expansion
- Immune cell trafficking between local and systems scales
- Interferon slows down replication
- Paracrine secretion of interferons further slows

Try this model yourself!

<https://nanohub.org/tools/pc4covid19>

Current time: 0 days, 0 hours, and 0.00 minutes, z = 0.00 μm
2871 agents

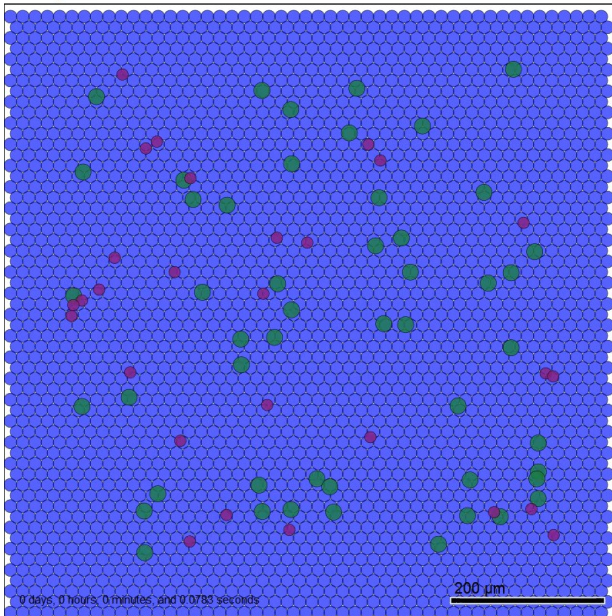

Type I interferon signaling slow progression

Current time: 0 days, 0 hours, and 0.00 minutes, z = 0.00 μm
2871 agents

no paracrine secretion

Current time: 0 days, 0 hours, and 0.00 minutes, z = 0.00 μm
2871 agents

moderate paracrine secretion

Current time: 0 days, 0 hours, and 0.00 minutes, z = 0.00 μm
2871 agents

high paracrine secretion

- Uninfected cell
- Infected cell
- Dead cell
- Macrophage (inactive)
- Macrophage (active)
- Macrophage (exhausted)
- Macrophage (hyperactive)
- Neutrophil
- CD8 T cell
- CD4 T cell
- DC (inactive)
- DC (active)

Preliminary work: coupled fibrosis

- Recruited fibroblasts re=seek damage from CD8+ T cells
- Fibroblasts deposit collagen

Hohammad Aminul
Islam
Oklahoma State

Ashlee N. Ford-
Versypt
Oklahoma State

Collagen deposited at t = 8640.0 min, z = 0.00 micron

- Uninfected cell
- Infected cell
- Dead cell
- Macrophage (inactive)
- Macrophage (active)
- Macrophage (exhausted)
- Macrophage (hyperactive)
- Neutrophil
- CD8 T cell
- CD4 T cell
- DC (inactive)
- DC (active)

Other ongoing work in v4

- Improved viral binding and replication models
 - Stochastic events for better continuum-discrete "conversion"
- Detailed infected cell pyroptosis model
- PKPD for current antiviral drugs

So what are we learning?

- The immune response is multi-pronged
 - "Scouting" cells (macrophages, dendritic cells) kick off increased immune activity
 - Interferon response helps slow replication in infected cells
 - Interferon responses by infected cells help "warn" nearby cells
 - Interferon responses by uninfected cells help spread the warning signal faster
 - T cell expansion in lymph node drives a more robust longer-term response
 - Interferon response appears to "bridge" the gap between initial infection and later immune response
 - ◆ Too early for immune detection, but early enough to cause trouble.
- Some unanswered questions:
 - Can an infected cell infect itself (thus speeding replication)?
 - ◆ If not, why/how not?
 - What about damage to nearby uninfected cells? (v5 question)
 - ◆ Can this be protective?
 - How do neutralizing antibodies change the dynamic in a naïve response?
 - How do neutralizing antibodies change the dynamics in an immunized individual?

Let's try it!

LUDDY

SCHOOL OF INFORMATICS, COMPUTING, AND ENGINEERING

Macklin Lab
 [@MathCancer](#)
[MathCancer.org](#)

Some investigations

- Base model parameters
- Reducer MOI (multiplicity of infection) to 0.01
 - parameters tab
 - ◆ multiplicity_of_infection = 0.01
- Increase interferon secretion (autocrine and paracrine) by 10×
 - cell types tab for lung epithelial cells
 - ◆ interferon_secretion_rate_via_infection = 0.5
 - ◆ interferon_secretion_rate_via_paracrine = 5
- Increase interferon inhibition to 0.99
 - cell types tab for lung epithelial cells
 - ◆ interferon_max_virus_inhibition = 0.99

Try this model yourself!

<https://nanohub.org/tools/pc4covid19>

LUDDY

SCHOOL OF INFORMATICS, COMPUTING, AND ENGINEERING

Macklin Lab
 **@MathCancer**
MathCancer.org

Next steps

- **v5 model**

- Negative feedbacks (anti-inflammation signals)
- Antibodies
- "bystander" effects (collateral damage to uninfected cells)

- **v6 model (final release candidate)**

- Fine tuning parameters
- Parameter space exploration on HPC, ML-guided analysis
- Prototype 3D tissue geometry
- Pivot to Phase III
 - ◆ Documentation and training materials
 - ◆ Long-term support
 - ◆ Data & results clearinghouse

Learning from other domains

- **Key shared biology across many problems**
 - Inflammation
 - Tissue damage
 - Innate and adaptive immune responses
- **Mixing expertise from many fields**
 - Software tools & HPC from math oncology
 - Domain experts in immunology and microbiology
 - Domain experts in tissue mechanics and damage
- **Reusable open source software modules** can be used beyond COVID-19
- **Future cancer advances**
 - Tumor-associated macrophage and fibroblasts
 - Cancer inflammation
 - viral carcinogenesis, oncolytic virus therapies
 - CAR T cell therapies, other immunotherapies

**We've learned how to coordinate big teams to rapidly build multiscale models.
We should do this for other problems!**
