Follow the approach of Lecture 16 to compute the magneto-conductivity tensor for graphene, which has an $E(k)$ given by:

$$E(k) = \pm \hbar v_F \sqrt{k_x^2 + k_y^2}$$

1) Show that the approach used in Lecture 16, DOES NOT work for graphene, and explain why.

2) See if you can find a way to solve the BTE for graphene when a small magnetic field is present.
